HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

DETAILED ACTION

Allowable Subject Matter

1. Claims 1-11 are allowed. The following is an examiner's statement of reasons for allowance.
2. The invention is a method for treating fluid, particularly waste water, and is shown below.

3. The steps of the method are:
 - a. Provide a coagulator-flocculator 1 and/or 3, a clarifier 2 (flotation unit or settler), and a micro-, ultra-, nano- or hyperfiltration membrane.
 - b. Make a double injection of one or more coagulation reagents
 - i. The first injection is upstream of the clarification step. The first injection is 75.0 to 125% of the optimal coagulation dose – where the

optimal coagulation dose is defined as the dose cancelling zeta potential.

- ii. The second injection is upstream of the membrane filtration step. The second injection is 0.1 to 25% of the optimal dose cancelling the zeta potential.

4. The closest prior art is Yasuda (JP5068993A, Mar. 23, 1993 – Abstract, Patent Publication, Translation) in further view of Langlais (WO010141606 A1, Jun. 14, 2001 – US 6974544 B1 will be cited). As can be seen from Fig. 1 of Yasuda below, Yasuda discloses a first dose of coagulant 2 before the separation tank 4 and a second dose of coagulant 7 upstream of the ultrafiltration membrane 9.

Yasuda, Fig. 1

[図 1]

5. Yasuda discloses the claimed invention except for the specific concentrations of coagulation reagents recited, based on zeta potential. Regarding these, Langlais teaches, “It is known that filtration (micro-, ultra-, nano- or hyperfiltration) membranes are sensitive to clogging by various types of substances: dissolved substances, such as organic materials, substances in the colloidal state, such as metal hydroxides, or, in

Art Unit: 1797

general, substances in suspension (suspended matter or SM)." Langlais, col. 1, lines 13-18. Langlais further teaches, "It is also known . . . that coagulation makes it easier to remove the suspended and colloidal matter. . . . There are several approaches for characterizing this phenomenon [including] . . . by measuring the zeta potential (ZP) and especially the variation in the said ZP as a function of the doses of metal salt added, until that dose which makes the ZP zero, and which therefore corresponds to the required level of treatment for obtaining optimum coagulation, is determined. . . . [This] lead[s] to a definition of a coagulant dose called the 'optimum coagulation dose' which, from the experience gained by those skilled in the art, is the dose which allows the best clarification treatment of the water being treated and which, consequently, will ensure the optimum working conditions of the membrane (that is to say the least fouling conditions)." Langlais, col. 1, lines 29, 32-33, 37-38, and 42-55. This is applicant's recited first injection of coagulation reagent of 75.0% to 125% of the optimal coagulation dose based on zeta potential.

6. Regarding the second injection of coagulation reagent, Langlais discloses, "The method includes adding a dose of a preselected coagulation reactant to the effluent before the effluent passes over the membrane. The added dose is a fraction of the coagulating reactant dose (X) that would render the zeta potential of the effluent equal to zero. The range of the added dose is $X/30$ - $X/80$. The suspended matter in the effluent is subjected to the added dose of coagulation reactant for destabilizing the suspended matter."

Langlais, Abstract, lines 3-11. In other words, Langlais discloses a second injection of coagulation reagent upstream of the membrane in the recited 0.1 to 25.0% range of the optimal dose cancelling the zeta potential.

Art Unit: 1797

7. To recap, Yasuda discloses the claimed invention except for the specific concentrations of the two coagulation agent doses, based on zeta potential. Specifically, Yasuda does not disclose the first dose being 75.0% to 125% the optimal coagulation dose and the second dose being 0.1 to 25.0% the optimal coagulation dose. Langlais teaches the recited concentrations, based on zeta potential, each applied as single dose in a given run, but does not disclose first one dose and then a second dose applied in the same run. As such, it would have not have been obvious to combine Yasuda with Langlais.

8. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Denise R. Anderson whose telephone number is (571)270-3166. The examiner can normally be reached on Monday through Thursday, from 8:00 am to 6:00 pm.
